

### Features

- Independent Over-Current Limiting On Each Output
- Independent Over-Temperature Limiting On Each Output
- Output Drivers Capable of Switching 700mA Load
- Inputs Compatible With TTL or 5V CMOS Logic
- Suitable For Resistive, Lamp or Inductive Loads
- Power-Frame Package Construction For Good Heat Dissipation
- Operating Temperature Ranges
  - CA3262A ..... -40°C to 125°C
  - CA3262 ..... -40°C to 85°C

### Applications

- Solenoids
- Relays
- Lamps
- Steppers
- Small Motors
- Displays

### System Applications

- Automotive
- Appliances
- Industrial Controls
- Robotics

### Ordering Information

PART NUMBER	TEMP. RANGE (°C)	PACKAGE	PKG. NO.
CA3262E	-40 to 85	16 Ld PDIP	E16.3
CA3262AE	-40 to 125	16 Ld PDIP	E16.3
CA3262AQ	-40 to 125	28 Ld PLCC	N28.45
CA3262AM	-40 to 125	24 Ld SOIC (W)	M24.3

### Description

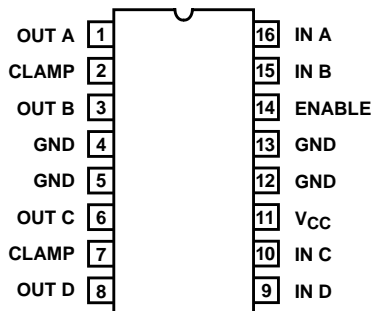

The CA3262 and CA3262A are used to interface low-level logic to high current loads. Each Power Driver has four inverting switches consisting of a non-inverting logic input stage and an inverting low-side driver output stage. All inputs are 5V TTL/CMOS logic compatible and have a common Enable input. Each output device has independent current limiting ( $I_{LIM}$ ) and thermal limiting ( $T_{LIM}$ ) for protection from over-load conditions. Steering diodes connected from each output (in pairs) to the Clamp pins may be used in conjunction with external zener diodes to protect the IC against over-voltage transients that result from inductive load switching.

To allow for maximum heat transfer from the chip, all ground pins on the DIP, PLCC and SOIC packages are directly connected to the mounting pad of the chip. Integral heat spreading lead frames directly connect the bond pads and ground leads to conduct heat from the chip junction to the PC Board for good heat dissipation.

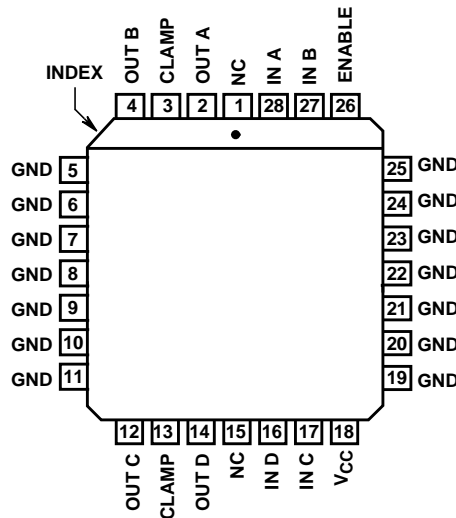

The CA3262 and CA3262A can drive four incandescent lamp loads without modulating their brilliance when the "cold" lamps are energized. Outputs may be parallel connected to drive high current loads. The maximum output current of each output is determined by the over-current limiting threshold which is typically 1.2A but may be as low as 0.7A.

**NOTES:**

- The CA3262 and CA3262A have on-chip limiting for transient peak currents. Under short-circuit conditions with voltage applied to the collector of the output transistor and with the output transistor turned ON, the current will increase to 1.2A, typical. Over-Current Limiting protects a short circuit condition for a normal operating range of output supply voltage. During a short circuit condition, the output driver will shortly thereafter (approx. 5ms) go into Over-Temperature Limiting. While Over-Current Limiting may range to peak currents greater than 2A, each output will typically withstand a direct short circuit up to supply voltage levels of 16V. Excessive dissipation before thermal limiting occurs may cause damage to the chip for supply voltages greater than 18V. The CA3262 and CA3262A are rated to withstand peak current, cold turn-on conditions of #168 or #194 lamp loads.
- The total DC current for the CA3262 and CA3262A with all 4 outputs ON should not exceed the total of  $(4 \times 0.7A + \text{Max. } I_{CC}) \sim 2.85A$ . This level of current will significantly increase the chip temperature due to increased dissipation and may cause thermal shutdown in high ambient temperature conditions (See Absolute Maximum Ratings for Dissipation). Any one output may be allowed to exceed 0.7A but may be subject to Over-Current Limiting above the  $I_{LIM}$  min. limit of 0.7A. As a practical limit, no single output should be loaded to more than 1A (Max).
- Normal applications require a surface mount of the 28 lead PLCC and 24 lead SOIC packages on a PC Board. The PLCC, SOIC and PDIP packages have power lead frame construction through the ground pins to conduct heat from the frame to the PC Board ground area. Thermal resistance,  $\theta_{JA}$ , is given for a surface mount of the 28 lead PLCC and the 24 lead SOIC packages on a 1 oz. copper PC board with minimal ground area and with 2 square inches of ground area.
- $I_{CC}$  varies with temperature. Typically,  $I_{CC(ON)}$  is 18mA at  $125^{\circ}C$  and 41mA at  $-40^{\circ}C$ . Typically,  $I_{CC(OFF)}$  is 2.2mA at  $125^{\circ}C$  and 1.2mA at  $-40^{\circ}C$ .
- Tested with a switched-off 500mA Load of 120mH (with 24 $\Omega$  series resistance),  $V_{BATT} = 12V$  and the outputs ( $V_{CE}$ ) clamped to +40V maximum with an external zener diode.

### Applications

Typical circuit configurations for applying the CA3262 and CA3262A are shown in the application circuit of Figure 2. To their rated capabilities, both circuits can be used to drive inductive, resistive and lamp loads. The CA3262A has a lower  $V_{SAT}$  than the CA3262 and is rated for  $125^{\circ}C$  ambient temperature applications. The CA3262 data sheet rating is  $85^{\circ}C$ . Otherwise, the protection features described apply to both the CA3262 and CA3262A.

The maximum voltage for full load current switching is the output sustaining voltage,  $V_{CE(SUS)}$  which should not exceed 40V. To provide a means of over-voltage protection, on-chip steering diodes are connected from each output to one of two CLAMP pins. Over-voltage pulses may be generated from inductive load switching and must be clamped or limited to a peak voltage less than  $V_{CE(SUS)}$ . To limit an inductive voltage pulse, a zener diode should be connected to the appropriate CLAMP pin. When the voltage pulse exceeds the zener threshold, the excess energy is dumped to ground via the on-chip steering diode and the external zener diode.

The on-chip diodes may be used in a free-wheeling mode by connecting the CLAMP pins to an external clamp supply voltage. Zener diode clamp protection is preferred over the power supply clamp option, primarily because the power supplies may be subject to large transient changes; including turn-ON and turn-OFF conditions where non-tracking conditions between supplies could allow forward conduction through the steering diodes. For all transient conditions of either method, the clamp voltage should be greater than the maximum supply voltage of the switching outputs and less than  $V_{CE(SUS)}$ .

Note that the rate of change of the output current during load switching is fast. Therefore, even small values of inductance, including the inductance of a few meters of hook-up wire to the load circuit, can generate voltage spikes of considerable amplitude at the output terminals and may require clamping to protect the device ratings.

Current-limiting is provided as protection for shorted or overloaded output conditions. Voltage is sampled across a small metal resistor in the emitter of each output stage. When the voltage exceeds a preset comparator level, drive is reduced to the output. Current limiting is sustained unless thermal conditions exceed the preset thermal shutdown temperature of  $155^{\circ}C$ .

If an output is shorted, the remaining three outputs will continue to function normally unless the continued heat spreading is sufficient to raise the junction temperature at any other output to a level greater than  $155^{\circ}C$ . High ambient temperature conditions may allow this to happen. The degree of interaction is minimized at chip layout design by separating the output devices, each to a separate corner of the chip.

As noted, the thermal resistance values of the PDIP, PLCC and SOIC packages are improved by direct connection of the leads to the chip mounting pad. For a normal PC Board application, the thermal resistance coefficient for each package can be significantly lowered by increasing ground copper area on the PC board next to the ground pins of the IC.

NOTES:

- Controlling Dimensions: INCH. In case of conflict between English and Metric dimensions, the inch dimensions control.
- Dimensioning and tolerancing per ANSI Y14.5M-1982.
- Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication No. 95.
- Dimensions A, A1 and L are measured with the package seated in JEDEC seating plane gauge GS-3.
- D, D1, and E1 dimensions do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.010 inch (0.25mm).
- E and e<sub>A</sub> are measured with the leads constrained to be perpendicular to datum -C-.
- e<sub>B</sub> and e<sub>C</sub> are measured at the lead tips with the leads unconstrained. e<sub>C</sub> must be zero or greater.
- B1 maximum dimensions do not include dambar protrusions. Dambar protrusions shall not exceed 0.010 inch (0.25mm).
- N is the maximum number of terminal positions.
- Corner leads (1, N, N/2 and N/2 + 1) for E8.3, E16.3, E18.3, E28.3, E42.6 will have a B1 dimension of 0.030 - 0.045 inch (0.76 - 1.14mm).
