FAIRCHILD SEMICONDUCTOR®

May 2007

FSQ0365, FSQ0265, FSQ0165, FSQ321, FSQ311 Green Mode Fairchild Power Switch (FPS™) for Valley Switching Converter - Low EMI and High Efficiency

Features

- Optimized for Valley Switching (VSC)
- Low EMI through Variable Frequency Control and Inherent Frequency Modulation
- High-Efficiency through Minimum Voltage Switching
- Narrow Frequency Variation Range over Wide Load and Input Voltage Variation
- Advanced Burst-Mode Operation for Low Standby Power Consumption
- Pulse-by-Pulse Current Limit
- Various Protection Functions: Overload Protection (OLP), Over-Voltage Protection (OVP), Abnormal Over-Current Protection (AOCP), Internal Thermal Shutdown (TSD)
- Under-Voltage Lockout (UVLO) with Hysteresis
- Internal Start-up Circuit
- Internal High-Voltage SenseFET (650V)
- Built-in Soft-Start (15ms)

Applications

- Power Supply for DVP Player and DVD Recorder, Set-Top Box
- Adapter
- Auxiliary Power Supply for PC, LCD TV, and PDP TV

Related Application Notes

- AN-4137, AN-4141, AN-4147, AN-4150 (Flyback)
- AN-4134 (Forward)

Description

A Valley Switching Converter generally shows lower EMI and higher power conversion efficiency than a conventional hard-switched converter with a fixed switching frequency. The FSQ-series is an integrated Pulse-Width Modulation (PWM) controller and SenseFET specifically designed for valley switching operation with minimal external components. The PWM controller includes an integrated fixed-frequency oscillator, Under-Voltage Lockout, Leading Edge Blanking (LEB), optimized gate driver, internal soft-start, temperature-compensated precise current sources for loop compensation, and self-protection circuitry.

Compared with discrete MOSFET and PWM controller solutions, the FSQ-series reduces total cost, component count, size and weight; while simultaneously increasing efficiency, productivity, and system reliability. This device provides a basic platform that is well suited for cost-effective designs of valley switching fly-back converters.

FPS™ is a trademark of Fairchild Semiconductor Corporation.

Notes:
1. The junction temperature can limit the maximum output power.
2. $230V_{AC}$ or $100/115V_{AC}$ with doubler. The maximum power with CCM operation.
3. Typical continuous power in a non-ventilated enclosed adapter measured at 50°C ambient temperature.
4. Maximum practical continuous power in an open-frame design at 50°C ambient.
5. PB-free package per JEDEC J-STD-020B.

Internal Block Diagram

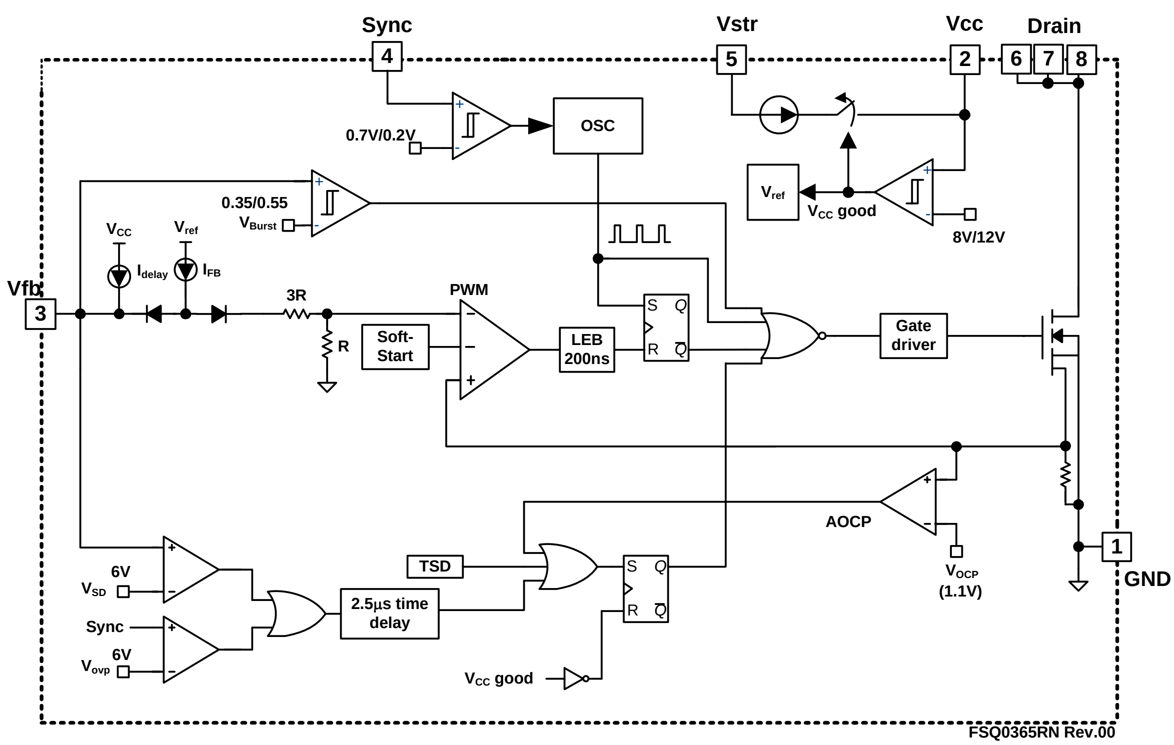

Figure 2. Functional Block Diagram

Pin Configuration

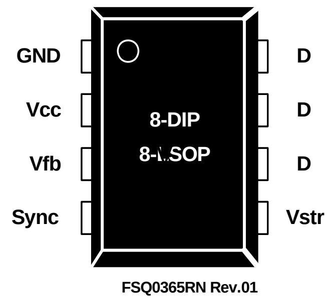

Figure 3. Pin Configuration (Top View)

Pin Definitions

Pin #	Name	Description
1	GND	SenseFET source terminal on primary side and internal control ground.
2	Vcc	Positive supply voltage input. Although connected to an auxiliary transformer winding, current is supplied from pin 5 (Vstr) via an internal switch during startup (see Internal Block Diagram Section). It is not until V_{CC} reaches the UVLO upper threshold (12V) that the internal start-up switch opens and device power is supplied via the auxiliary transformer winding.
3	Vfb	The feedback voltage pin is the non-inverting input to the PWM comparator. It has a 0.9mA current source connected internally while a capacitor and optocoupler are typically connected externally. There is a time delay while charging external capacitor Cfb from 3V to 6V using an internal 5µA current source. This time delay prevents false triggering under transient conditions but still allows the protection mechanism to operate under true overload conditions.
4	Sync	This pin is internally connected to the sync-detect comparator for valley switching. Typically the voltage of the auxiliary winding is used as Sync input voltage and external resistors and capacitor are needed to make time delay to match valley point. The threshold of the internal sync comparator is 0.7V/0.2V.
5	Vstr	This pin is connected to the rectified AC line voltage source. At start-up the internal switch supplies internal bias and charges an external storage capacitor placed between the Vcc pin and ground. Once the Vcc reaches 12V, the internal switch is opened.
6,7,8	Drain	The drain pins are designed to connect directly to the primary lead of the transformer and are capable of switching a maximum of 700V. Minimizing the length of the trace connecting these pins to the transformer will decrease leakage inductance.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only. T_A = 25°C, unless otherwise specified.

Symbol	Characteristic		Min.	Max.	Unit
V_{STR}	V_{str} Pin Voltage		500		V
V_{DS}	Drain Pin Voltage		650		V

15. Propagation delay in the control IC.
16. Includes gate turn-on time.

Comparison Between FSDM0x65RNB and FSQ-Series

Function	FSDM0x65RNB	FSQ-Series	FSQ-Series Advantages
Operation method	Constant frequency PWM	Valley switching operation	■ Improved efficiency by valley switching ■ Reduced EMI noise
EMI reduction	Frequency modulation	Valley switching & inherent frequency modulation	■ Reduce EMI noise by two ways
Burst-mode operation	Fixed burst peak	Advanced burst-mode	■ Improved standby power by valley switching also in burst-mode ■ Because the current peak during burst operation is dependent on V_{FB}, it is easier to solve audible noise
Protection		AOCP	■ Improved reliability through precise abnormal over-current protection

Functional Description

1. Startup: At startup, an internal high-voltage current source supplies the internal bias and charges the external capacitor (C_a) connected to the Vcc pin, as illustrated in Figure 20. When V_{CC} reaches 12V, the FPS begins switching and the internal high-voltage current source is disabled. The FPS continues its normal switching operation and the power is supplied from the auxiliary transformer winding unless V_{CC} goes below the stop voltage of 8V.

FSQ

4. Protection Circuits: The FSQ-series has several self-protective functions, such as Overload Protection (OLP), Abnormal Over-Current protection (AOCP), Over-Voltage Protection (OVP), and Thermal Shutdown (TSD). All the protections are implemented as auto-restart mode. Once the fault condition is detected, switching is terminated and the SenseFET remains off. This causes V_{CC} to fall. When V_{CC} falls down to the Under-Voltage Lockout (UVLO) stop voltage of 8V, the protection is reset and start-up circuit charges V_{CC} capacitor. When the V_{CC} reaches the start voltage of 12V, the FSQ-series resumes normal operation. If the fault condition is not removed, the SenseFET remains [redacted] and V_{CC} drops to stop voltage again. In this manner, [redacted] auto-restart can alternately enable and disable [redacted] switching of the power SenseFET until the fault co[redacted]

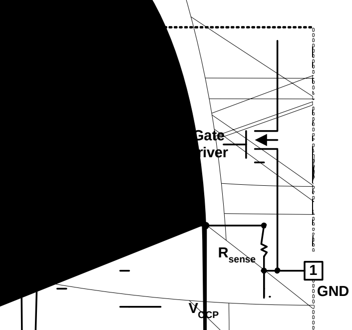

Figure 25. Abnormal Over-Current Protection

Fairchild Power Switch (FPS™)

4.3 Over-Voltage Protection (OVP): If the secondary side feedback circuit malfunctions or a solder defect causes an opening in the feedback path, the current through the opto-coupler transistor becomes almost zero. Then, V_{FB} climbs up in a similar manner to the overload situation, forcing the preset maximum current to be supplied to the SMPS until the overload protection triggers. Because more energy than required is provided to the output, the output voltage may exceed the rated voltage before the overload protection triggers, resulting in the breakdown of the devices in the secondary side. To prevent this situation, an OVP circuit is employed. In general, the peak voltage of the sync signal is proportional to the output voltage and the FSQ-series uses a sync signal instead of directly monitoring the output voltage. If the sync signal exceeds 6V, an OVP is triggered, shutting down the SMPS. To avoid undesired triggering of OVP during normal operation, the peak voltage of the sync signal should be designed below 6V.

4.4 Thermal Shutdown (TSD): The SenseFET and the control IC are built in one package. This makes it easy for the control IC to detect the abnormal over temperature of the SenseFET. If the temperature exceeds ~150°C, the thermal shutdown triggers.

5. Soft-Start: The FPS has an internal soft-start circuit that increases PWM comparator inverting input voltage with the SenseFET current slowly after it starts up. The typical soft-start time is 15ms, The pulse width to the power switching device is progressively increased to establish the correct working conditions for transformers, inductors, and capacitors. The voltage on the output capacitors is progressively increased with the intention of smoothly establishing the required output voltage. This mode helps prevent transformer saturation and reduces stress on the secondary diode during startup.

6. Burst Operation: To minimize power dissipation in standby mode, the FPS enters burst-mode operation. As the load decreases, the feedback voltage decreases. As shown in Figure 26, the device automatically enters burst-mode when the feedback voltage drops below V_{BURL} (350mV). At this point, switching stops and the output voltages start to drop at a rate dependent on standby current load. This causes the feedback voltage to rise. Once it passes V_{BURH} (550mV), switching resumes. The feedback voltage then falls and the process repeats. Burst-mode operation alternately enables and disables switching of the power SenseFET, thereby reducing switching loss in standby mode.

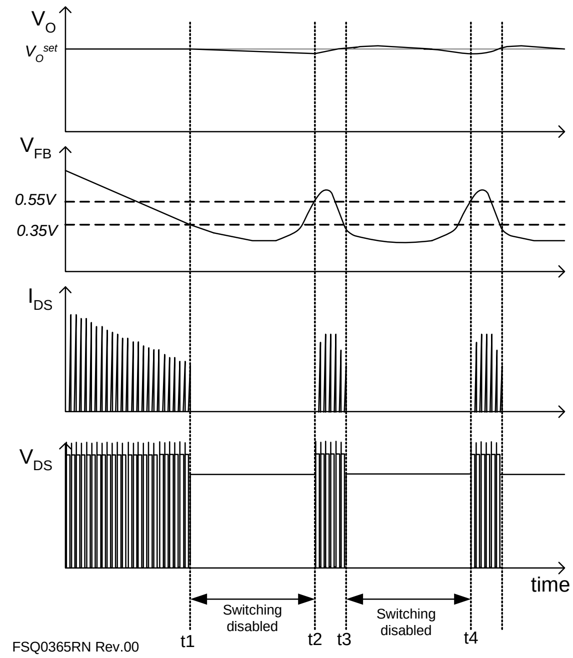

Figure 26. Waveforms of Burst Operation

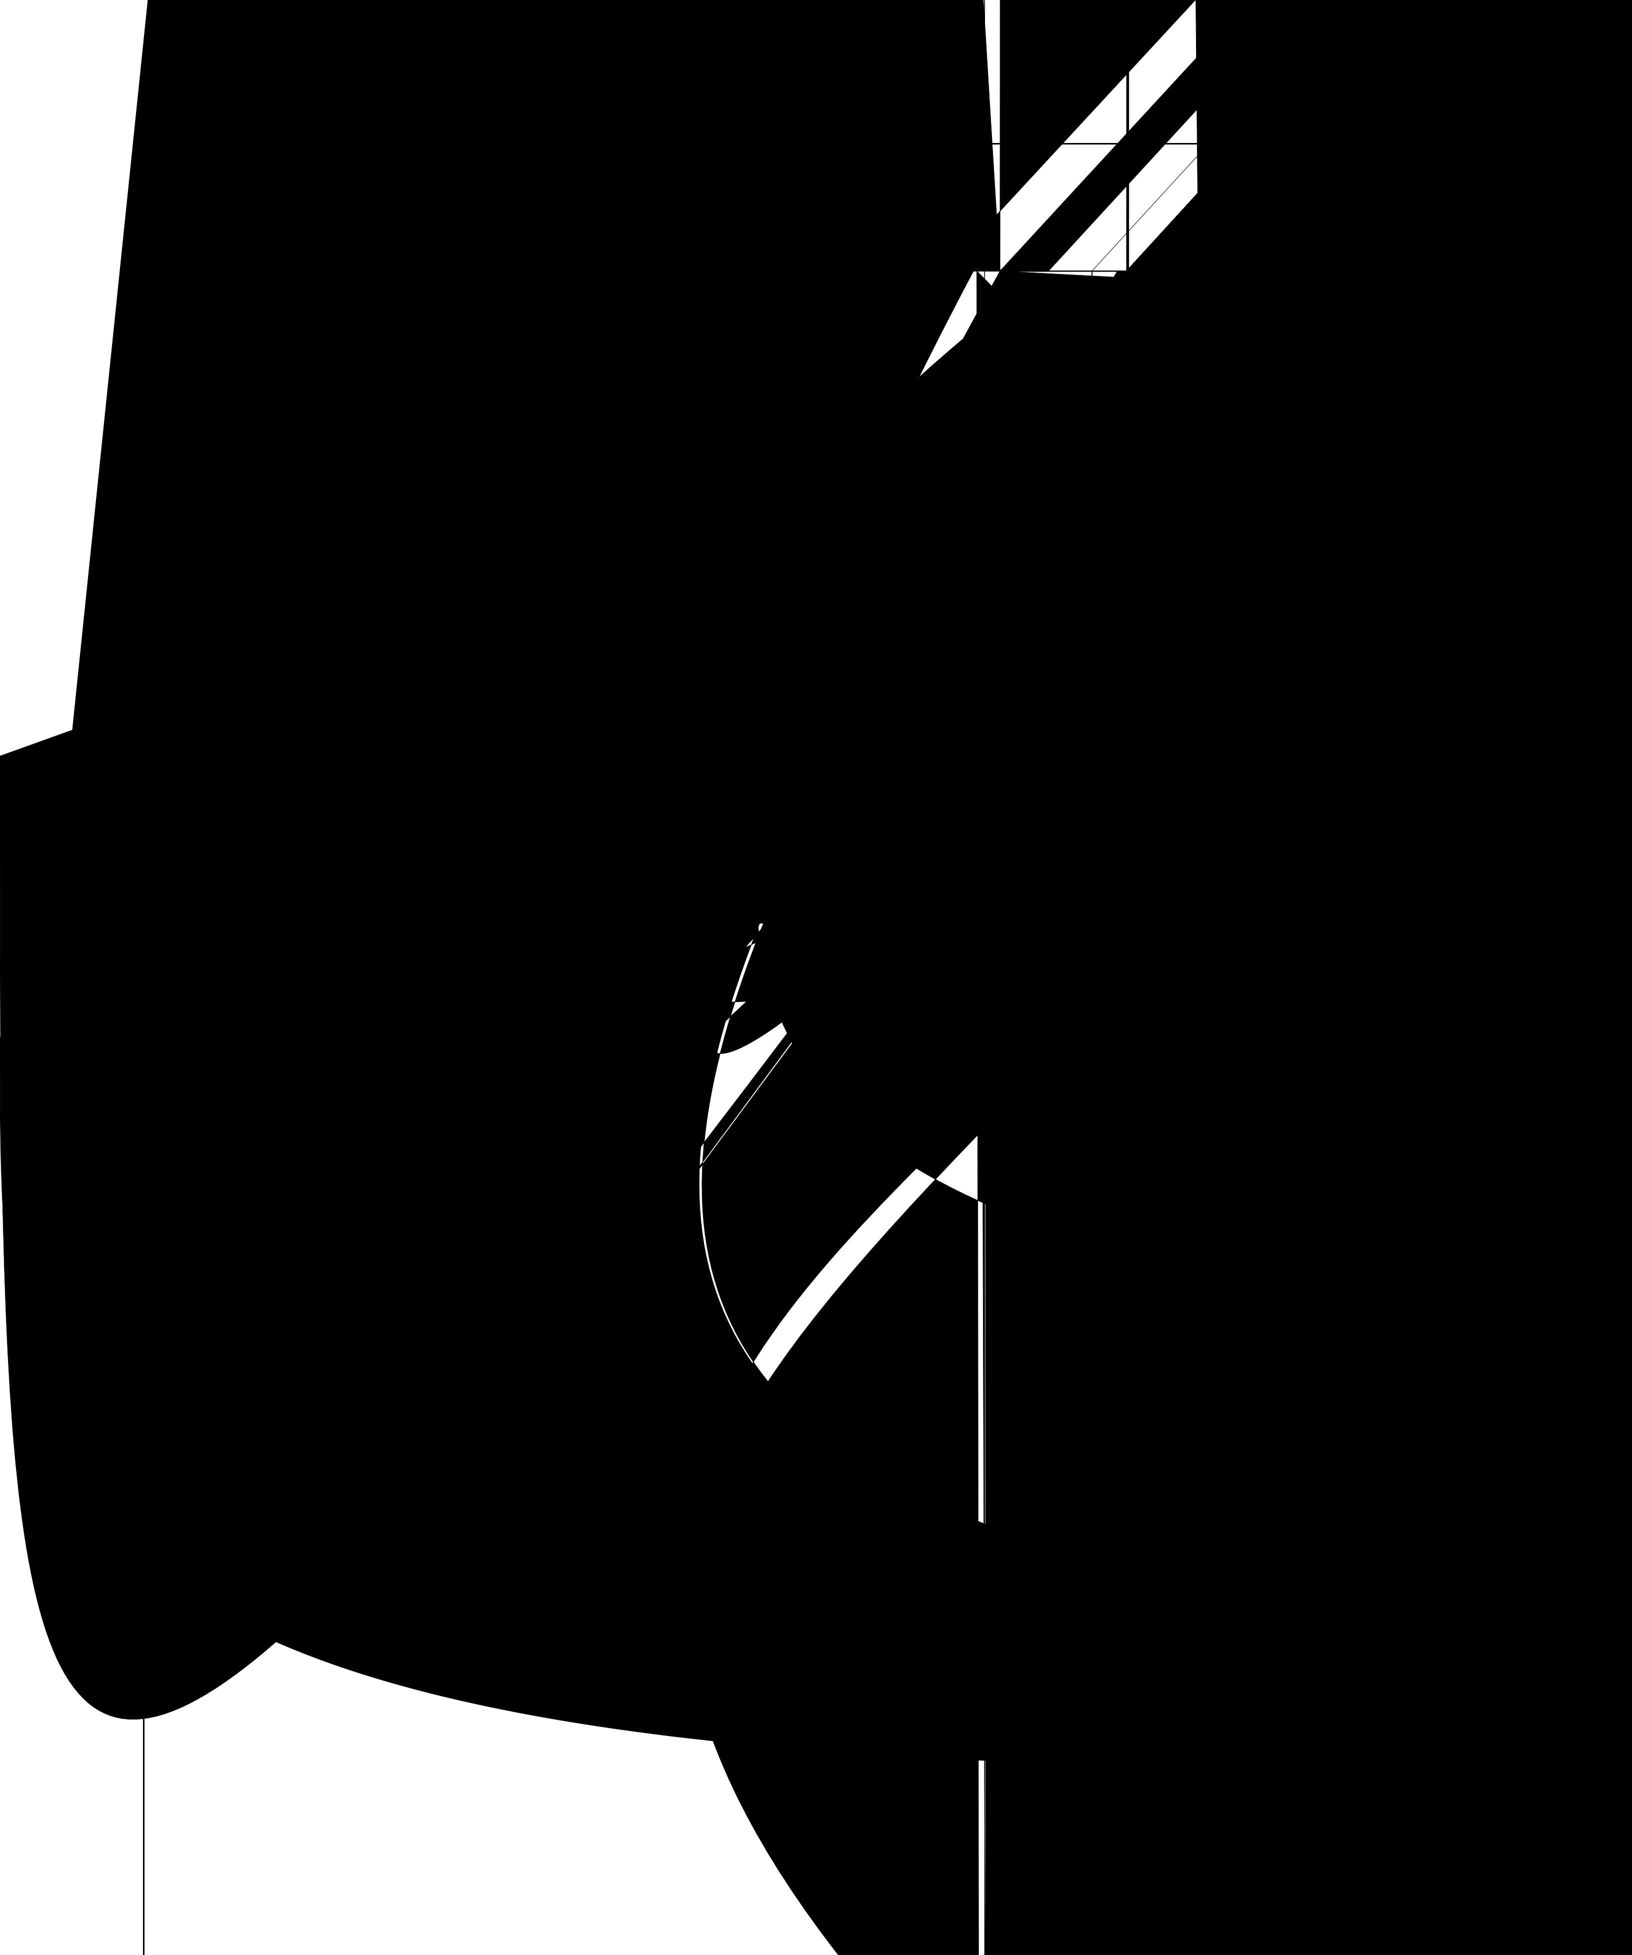
7. Switching Frequency Limit: To minimize switching loss and EMI (Electromagnetic Interference), the MOSFET turns on when the drain voltage reaches its minimum value in valley switching operation. However, this causes switching frequency to increases at light load conditions. As the load decreases, the peak drain current diminishes and the switching frequency increases. This results in severe switching losses at light-load condition, as well as intermittent switching and audible noise. Because of these problems, the valley switching converter topology has limitations in a wide range of applications.

To overcome this problem, FSQ-series employs a frequency-limit function, as shown in Figures 27 and 28. Once the SenseFET is turned on, the next turn-on is prohibited during the blanking time (t_B). After the blanking time, the controller finds the valley within the detection time window (t_W) and turns on the MOSFET, as shown in Figures 27 and 28 (Cases A, B, and C). If no valley is found during t_W, the internal SenseFET is forced to turn on at the end of t_W (Case D). Therefore, our devices have a minimum switching frequency of 55kHz and a maximum switching frequency of 67kHz, as shown in Figure 28.



Typical Application Circuit of FSQ0365RN

Application	FPS Device	Input Voltage Range	Rated Output Power	Output Voltage (Max. Current)
DVD Player Power Supply	FSQ0365RN	85-265V_{AC}	19W	5.1V (1.0A) 3.4V (1.0A) 12V (0.4A) 16V (0.3A)

Features

- High efficiency (>77% at universal input)
- Low standby mode power consumption (<1W at 230V_{AC} input and 0.5W load)
- Reduce EMI noise through Valley Switching operation
- Enhanced system reliability through various protection functions
- Internal soft-start (15ms)

Key Design Notes

- The delay time for overload protection is designed to be about 30ms with C107 of 47nF. If faster/slower triggering of OLP is required, C107 can be changed to a smaller/larger value (eg. 100nF for 60ms).
- The input voltage of V_{sync} must be higher than -0.3V. By proper voltage sharing by R106 & R107 resistors, the input voltage can be adjusted.
- The SMD-type 100nF capacitor must be placed as close as possible to V_{CC} pin to avoid malfunction by abrupt pulsating noises and to improved surge immunity.

R203	6.2kΩ	1/4W	D201	UF4003	
R204	20kΩ	1/4W	D202	UF4003	
R205	6kΩ	1/4W	D203	SB360	
Capacitor			D204	SB360	
C101	100nF/275V_{AC}	Box Capacitor			
C102	100nF/275V_{AC}	Box Capacitor	**IC**		
C103	33µF/400V	Electrolytic Capacitor	IC101	FSQ0365RN	FPS™
C104	10nF/630V	Film Capacitor	IC201	KA431 (TL431)	Voltage reference
C105	47nF/50V	Mono Capacitor	IC202	FOD817A	Opto-coupler
C106	100nF/50V	SMD (1206)	**Fuse**		
C107	22µF/50V	Electrolytic Capacitor	Fuse	2A/250V	
C110	33pF/50V	Ceramic Capacitor	**NTC**		
C201	470µF/35V	Electrolytic Capacitor	RT101	5D-9	
C202	470µF/35V	Electrolytic Capacitor	**Bridge Diode**		
C203	470µF/35V	Electrolytic Capacitor	BD101	2KBP06M2N257	Bridge Diode
C204	470µF/35V	Electrolytic Capacitor	**Line Filter**		
C205	1000µF/10V	Electrolytic Capacitor	LF101	40mH	
C206	1000µF/10V	Electrolytic Capacitor	**Transformer**		
C207	1000µF/10V	Electrolytic Capacitor	T101		
C208	1000µF/10V	Electrolytic Capacitor	**Varistor**		
C209	100nF /50V	Ceramic Capacitor	TNR	10D471K	

Typical Application Circuit of FSQ311

Application	FPS Device	Input Voltage Range	Rated Output Power	Output Voltage (Max. Current)
DVD Player Power Supply	FSQ311	85-265V_{AC}	8W	5.1V (0.9A) 3.3V (0.9A) 12V (0.03A) 16V (0.03A)

Features

- High efficiency (>70% at universal input)
- Low standby mode power consumption (<1W at 230V_{AC} input and 0.5W load)
- Reduce EMI noise through Valley Switching operation
- Enhanced system reliability through various protection functions
- Internal soft-start (15ms)

Key Design Notes

- The delay time for overload protection is designed to be about 30ms with C107 of 47nF. If faster/slower triggering of OLP is required, C107 can be changed to a smaller/larger value (eg. 100nF for 60ms).
- The input voltage of V_{sync} must be higher than -0.3V. By proper voltage sharing by R106 & R107 resistors, the input voltage can be adjusted.
- The SMD-type 100nF capacitor must be placed as close as possible to V_{CC} pin to avoid malfunction by abrupt pulsating noises and to improved surge immunity.

3. Winding Specification

No	Pin (s→f)	Wire	Turns	Winding Method
$N_p/2$	3 → 2	$0.2^{\phi} \times 1$	111	Solenoid Winding, 2 Layers
Insulation: Polyester Tape t = 0.025mm, 2 Layers				
Shield	1 → open	$0.1^{\phi} \times 2$		Shield winding
Insulation: Polyester Tape t = 0.025mm, 1 Layer				
N_{5V}	7 → 8	$0.2^{\phi} \times 3$	15	Center Solenoid Winding
Insulation: Polyester Tape t = 0.025mm, 1 Layer				
$N_{3.3V}$	9 → 8	$0.2^{\phi} \times 3$	10	Center Solenoid Winding
Insulation: Polyester Tape t = 0.025mm, 1 Layer				
N_{12V}	10 → 11	$0.1^{\phi} \times 1$	30	Solenoid Winding
N_{-12V}	11 → 12	$0.1^{\phi} \times 3$	33	Solenoid Winding
Insulation: Polyester Tape t = 0.025mm, 1 Layer				
Shield	1 → open	$0.1^{\phi} \times 2$		Shield winding
Insulation: Polyester Tape t = 0.025mm, 2 Layers				
N_{VCCV}	5 → 6	$0.1^{\phi} \times 1$	36	Center Solenoid Winding
Insulation: Polyester Tape t = 0.025mm, 2 Layers				
$N_p/2$	2 → 1	$0.2^{\phi} \times 1$	111	Solenoid Winding, 2 Layers
Insulation: Polyester Tape t = 0.025mm, 4 Layers				

4. Electrical Characteristics

	Pin	Specification	Remarks
Inductance	1 - 3	2.1mH ± 10%	66kHz, 1V
Leakage	1 - 3	100µH Max.	Short all other pins

5. Core & Bobbin

- Core: EE1927 (Ae=23.4mm^2)
- Bobbin: EE1927

6. Demo Board Part List

Part	Value	Note	Part	Value	Note
Resistor			**Inductor**		
R2	100kΩ	1/4W	L2	660µH

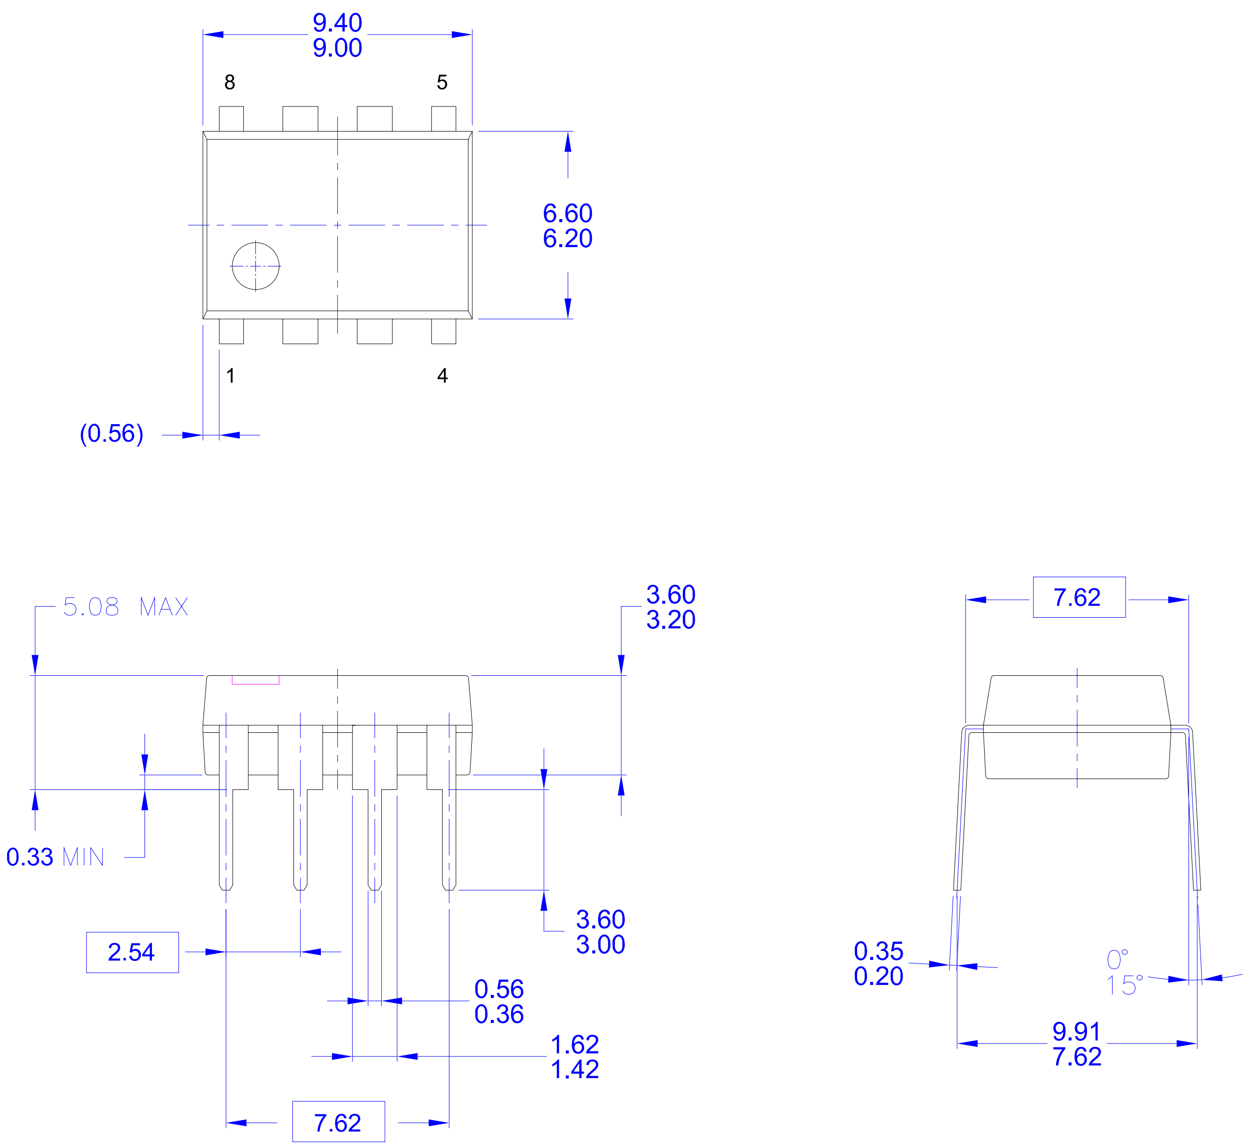
Package Dimensions

8-DIP

Dimensions are in millimeters unless otherwise noted.



NOTES: UNLESS OTHERWISE SPECIFIED

A) THIS PACKAGE CONFORMS TO JEDEC MS-001 VARIATION BA

B) ALL DIMENSIONS ARE IN MILLIMETERS.

C) DIMENSIONS ARE EXCLUSIVE OF BURRS, MOLD FLASH, AND TIE BAR EXTRUSIONS.

D) DIMENSION S AND TOLERANC ES PER A SME Y14.5 M-1994

MKT-N08FrevA

DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
2. A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

PRODUCT STATUS DEFINITIONS

Definition of Terms

Datasheet Identification	Product Status	Definition
Advance Information	Formative or In Design	This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	This datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
No Identification Needed	Full Production	This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
Obsolete	Not In Production	This datasheet contains specifications on a product that has been discontinued by Fairchild Semiconductor. The datasheet is printed for reference information only.
